Invesco Commodity Composite UCITS ETF

LGCU

Fund objective

The Invesco Commodity Composite UCITS ETF aims to track the total return performance of the Solactive Commodity Composite Index, less fees.

An investment in this fund is an acquisition of units in a passively managed, index tracking fund rather than in the underlying assets owned by the fund.

Risk indicator

Lower risk Higher risk

The Risk Indicator is subject to change and is correct based on the data available at the time of publication.

¹ Ongoing charge includes management fee, custody and administration costs but excludes transaction costs such as swap costs. The total cost is the sum of the ongoing charge figure and swap fee. Costs may increase or decrease as a result of currency and exchange rate fluctuations. Consult the legal documents for further information on costs.

Investment risks

For complete information on risks, refer to the legal documents. The value of investments, and any income from them, will fluctuate. This may partly be the result of changes in exchange rates. Investors may not get back the full amount invested. The Fund's ability to track the benchmark's performance is reliant on the counterparties to continuously deliver the performance of the benchmark in line with the swap agreements and would also be affected by any spread between the pricing of the swaps and the pricing of the benchmark. The insolvency of any institutions providing services such as safekeeping of assets or acting as counterparty to derivatives or other instruments, may expose the Fund to financial loss. Instruments providing exposure to commodities are generally considered to be high risk which means there is a greater risk of large fluctuations in the value of the instrument. The fund might purchase securities that are not contained in the reference index and will enter into swap agreements to exchange the performance of those securities for the performance of the reference index.

About the index

The Solactive Commodity Composite Index is a strategy index designed to offer high quality, diversified commodity exposure. It comprises a minimum of three constituent indices, selected from a universe of broad commodity indices. Index composition is reviewed at least once a year. A full description is available at www.solactive.com/indices.

Source: Invesco, Bloomberg L.P., FactSet. ETF performance shown is calculated with reference to the Net Asset Value, inclusive of net reinvested income and net of ongoing charges and portfolio transaction costs, in USD. The figures do not reflect the actual share price, the impact of the bid/offer spread or broker commissions. Returns may increase or decrease as a result of currency fluctuations. ETF NAV performance differs from that of the index due to the ongoing charges and portfolio transaction costs and due to the fact that the ETF does not necessarily always hold all the securities in the index in their respective weighting. This ETF does not charge an entry fee.

Glossary

Benchmark: An index against which the ETF is measured, in terms of relative performance, risk and other useful comparisons.

Derivative: Derivatives are financial instruments whose prices are driven by the price shifts or price expectations of another financial instrument, which is called the "underlying". Many derivatives are designed to react disproportionately to shifts in the price of the underlying. Derivatives can be used for both hedging and speculative purposes. The most common derivatives are certificates, options, futures and swaps.

ETF: Exchange traded fund. A type of fund that is traded on the stockmarket like ordinary shares. ETFs can be bought and sold during trading hours, like ordinary shares, whereas other types of funds are priced once a day only.

Futures Contract: An agreement between two parties to sell a certain quantity of goods on pre-determined terms, with delivery and settlement at a later point in time.

Hedged: The intended result of reducing the portfolio's exposure to a specific risk, such as the risk of fluctuations between currency exchange rates ("currency hedging").

Replication Method: Strategy employed by the fund to achieve its objective.

Spot Price: The spot price is the current date's price for securities, currencies, gold or other assets traded on that date. The spot price is in contrast to the futures price (i.e., a future price agreed today).

Swap: A swap is a derivative contract where two parties agree to exchange separate streams of cashflows or returns.

Synthetic Replication: Synthetic funds own a diversified portfolio of equities that may differ from the benchmark index. The ETF contracts with one or more banks (each a counterparty), which agree to pay any difference between the portfolio performance and the index performance, less any applicable fees. These contracts are known as swaps. Using swaps ensures accurate index tracking but introduces counterparty risk: if a counterparty failed to pay the index performance due under the swap contract, the ETF would instead rely on the performance of its portfolio of equities, which could be lower than the index performance. An ETF's exposure to a swap counterparty is limited by the UCITS regulation, and further limited by measures that we impose.

UCITS: Undertakings for Collective Investments in Transferable Securities. European regulatory framework for an investment vehicle that can be marketed across the European Union.
