Ostrum ASSET MANAGEMENT

Ostrum Global Emerging Bonds

FUND FACTSHEET

MARKETING COMMUNICATION - EXCLUSIVELY FOR PROFESSIONAL INVESTORS OR NON-PROFESSIONALS INVESTED IN THE FUND (1)

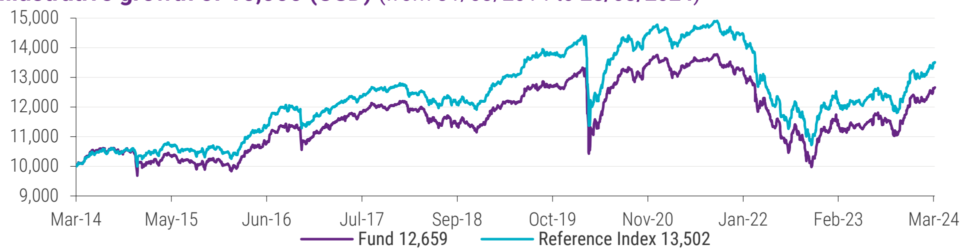
SHARE CLASS: I/A (USD) - LU0935234822 March 2024

Fund highlights

• Adopts an active management approach with the aim of tapping into emerging market debt, denominated in both local currencies and hard currencies (USD, EUR and G10 currencies).
• Invests mainly in emerging market sovereign bonds, but also in emerging corporate bonds by way of diversification. The fund may also invest a maximum of 30% of its net assets in developed market bonds.
• Relies on an independent fundamental and value investment process, intended to identify the most attractive issuers on the basis of their fundamentals and yield potential (in relation to the risks identified).

PERFORMANCE DATA SHOWN REPRESENTS PAST PERFORMANCE AND IS NOT A GUARANTEE OF FUTURE RESULTS.

Illustrative growth of 10,000 (USD) (from 31/03/2014 to 28/03/2024)



The performance indicated for the fund before its inception, for the period from october 04, 2011 to january 24, 2014 is based on the historic performance of Natixis Global Emerging Bonds, FCP collective investment fund under French law, registered with AMF, the financial market authority, and managed by the same management company using the same investment process. This performance has been adjusted to show the various charges applicable to the fund as accurately as possible.

RISK PROFILE

Lower risk — Higher risk

1	2	**3**	4	5	6	7

The category of the summary risk indicator is based on historical data.

Due to its exposure to fixed income markets, the Fund may experience medium volatility, as expressed by its rank on the above scale.
The Fund investment policy exposes it primarily to the following risks:

- Risk of capital loss
- Changes in Laws and/or Tax Regimes
- Counterparty risk
- Credit risk
- Emerging markets risk
- Exchange Rates
- Financial Derivatives Instruments
- Geographic concentration risk
- Interest rate risk
- Liquidity risk
- Portfolio Concentration risk
- Stock Connect risk
- Investment in CNH Bonds

The Fund is subject to sustainability risks.

For more information, please refer to the section detailing specific risks at the end of this document.

Some recent performance may be lower or higher. As the value of the capital and the returns change over time (notably due to currency fluctuations), the repurchase price of the shares can be higher or lower than their initial price. The performance indicated is based on the NAV (net asset value) of the share class, and is net of all charges applying to the fund but does not account for sale commissions, taxation or paying agent fees, and assumes that dividends if any are reinvested. Taking such fees or commissions into account would lower the returns. The performance of other share classes would be higher or lower based on the differences between the fees and the entry charges. In the periods where certain share classes are not subscribed or not yet created (inactive share classes), performance is calculated based on the actual performance of an active share class of the fund whose characteristics are considered by the management company as being closest to the inactive share class concerned, after adjusting it for the differences between the total expense ratios (TER), and converting any net asset value of the active share class in the currency in which the inactive share class is listed. The performance given for the inactive share class is the result of a calculation provided for information.

Please read the important information given in the additional notes at the end of this document.

(1) Please refer to the prospectus of the fund and to the KID before making any final investment decisions.

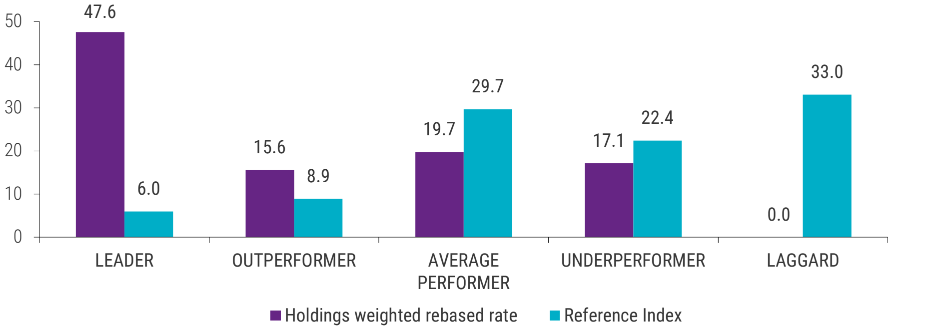
Rating ESG

Environmental, Social, and Governance (ESG) Rating, Sustainalytics' ratings for credit issuers. This is a rating from 0 to 100, the highest rating being 100.

In addition, within each sector, issuers are divided into five quintiles: « Leader », « Outperformer », « Average Performer », « Underperformer » and « Laggard ».

We typically use this rating for the sectoral aspect that serves our management process.

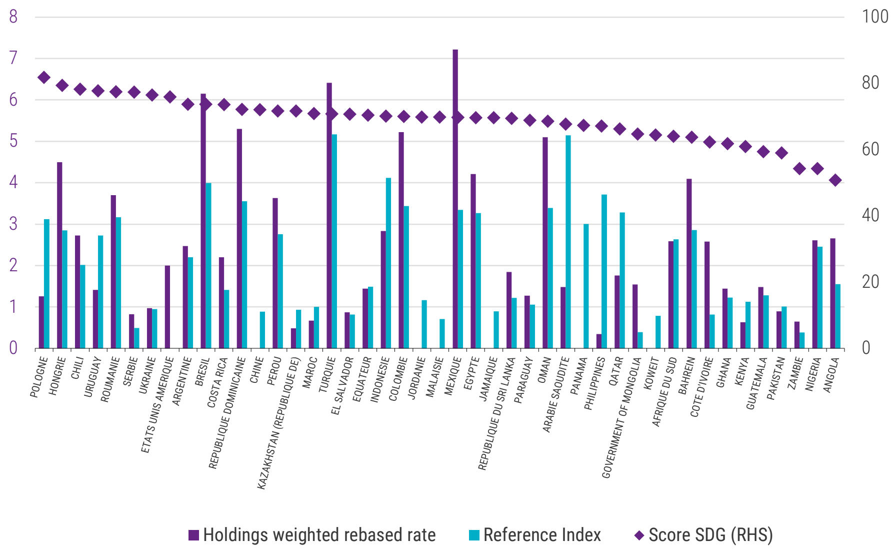


Sustainalytics scale from 'best' to at least 'good' : Leader, Outperformer, Average Performer, Underperformer, Laggard

SDG Index Score

SDG Index for Sovereign and Similar Issuers: this is a numerical score between 0 and 100, the best being 100.

The SDG Index tracks the progress made by countries in their pursuit of the 17 United Nations sustainable development goals (SDGs).



in % of AuM
SDG Index Score Scale: 100 being the highest score, 0 the lowest score

ALPARGATAS SAIC	0%	19	15,591

Source: Trucost

Ostrum AM uses Trucost to obtain all scope 1 and 2 carbon intensities for corporates and sovereigns. Scope 3 is not currently taken into account in the analysis, as recommended by SBTi. To obtain this data, Trucost collects greenhouse gas emissions through a variety of public sources, such as company financial reports, environmental data sources and data published on company websites or other public sources. Where no published data is available, Trucost's Extended Environmental Input-Output (EEIO) model combines industry-specific environmental impact data with quantitative macroeconomic data on the flow of goods and services between different sectors of the economy to obtain an estimated carbon emissions figure. Once the intensity of each emitter has been obtained, each portfolio's carbon intensity is calculated by summing the intensity of each emitter, weighted by its contribution to the portfolio. This figure corresponds to the Weighted Average Carbon Intensity (WACI), as recommended by the TCFD. Carbon intensity measures the volume of carbon emissions per dollar of turnover generated by the issuers in the portfolio over a given period. Further information on the methodology is available here: https://www.spglobal.com/spdji/en/documents/additional-material/faq-trucost.pdf

1. **The carbon intensity** corresponds to the volume of CO_2 emitted for a million dollars of turnover achieved. To calculate this intensity, we take into account not only the direct emissions related to the company's operations (**Scope 1**) but also those related to the provision of the necessary energy (**Scope 2**).
Carbon intensity of a company (tons of CO_2 / Millions of dollars in turnover) = (Scope 1 + Scope 2) / Millions of dollars in turnover.

2. The TCFD is the Financial Information Reporting Working Group established by the Financial Stability Board. The Financial Stability Board, or FSB , is an international economic grouping created at the G20 meeting in London in April 2009.

3. **Scope 1:** Greenhouse gas emissions from the combustion of fossil fuels and production processes owned or controlled by the company. **Scope 2:** Indirect gas emissions related to the company's energy consumption.

4. **Average carbon intensity of the fund** is the sum of the corporate carbon intensities weighted by portfolio weights.

5. The calculation of the average carbon intensity of the portfolio only takes into account the securities of private issuers held in our internal funds.

6. Represents the company's % contribution to the average carbon intensity of the portfolio.

7. Represents the number of tons of CO_2 emitted by the company on Scope 1 and Scope 2.

For more information about the implications of France's Law on Energy and Climate (Loi Energie Climat), please read Ostrum AM's latest report available on the Ostrum AM website.

Ostrum AM uses Trucost to obtain all scope 1 and 2 carbon intensities for corporates and sovereigns. Scope 3 is not currently taken into account in the analysis, as recommended by SBTi. To obtain this data, Trucost collects greenhouse gas emissions through a variety of public sources, such as company financial reports, environmental data sources and data published on company websites or other public sources. Where no published data is available, Trucost's Extended Environmental Input-Output (EEIO) model combines industry-specific environmental impact data with quantitative macroeconomic data on the flow of goods and services between different sectors of the economy to obtain an estimated carbon emissions figure. Once the intensity of each emitter has been obtained, each portfolio's carbon intensity is calculated by summing the intensity of each emitter, weighted by its contribution to the portfolio. This figure corresponds to the Weighted Average Carbon Intensity (WACI), as recommended by the TCFD. Carbon intensity measures the volume of carbon emissions per dollar of turnover generated by the issuers in the portfolio over a given period. Further information on the methodology is available here: https://www.spglobal.com/spdji/en/documents/additional-material/faq-trucost.pdf

1. Carbon intensity is the volume of CO_2 emitted per $1 million of GDP generated. To calculate it, we take into account the greenhouse gas (GHG) emissions of a State or of a quasi-sovereign issuer, including land distribution, land use change and forestry, as reported by PRIMAP.
Carbon intensity of a State (or a quasi-sovereign issuer): (tons of CO_2 / Millions of dollars of GDP) = (Carbon Emissions) / Millions of dollars of GDP.

2. The portfolio's average carbon intensity is the sum of the carbon intensities of the States (or quasi-sovereign issuers), weighted according to their share in the portfolio.

3. The calculation of the portfolio's average carbon intensity only considers the securities of sovereign issuers and quasi-sovereign issuers held in our internal funds.

4. Represents the % contribution of the State or quasi-sovereign issuer to the average carbon intensity of the portfolio.

5. Represents the number of millions of tons of CO_2 equivalent emitted by the issuer for its share of debt held in the portfolio. The Carbon Emissions of a State or quasi-sovereign issuer take into account its greenhouse gas (GHG) emissions, including land use, land use change and forestry as reported by PRIMAP.
PRIMAP is a database combining multiple sovereign carbon emissions datasets, published to create a comprehensive set of greenhouse gas emission trajectories for most countries in the UNFCCC (United Nations Framework Convention on Climate Change) as well as non-UNFCCC countries from 1850 onwards. This data represents the main greenhouse gas categories of the 2006 IPCC - Intergovernmental Panel on Climate Change (CO_2, CH_4, N_2O, etc.) Further information is available here: http://doi.org/10.5880/PIK.2016.003. Trucost is a data provider.
For more information about the implications of France's Law on Energy and Climate (Loi Energie Climat), please read Ostrum AM's latest report available on the Ostrum AM website.

Ostrum Global Emerging Bonds

Portfolio analysis as of 28/03/2024

FUND MANAGER'S COMMENT

The US economy remained on a positive trend this month, with Q4 2023 GDP growth revised up to 3.4% on an annualised basis. Residential sector data was good and household consumption remains the main growth driver. After the negative surprises on the CPI, the deflator followed by the Fed rose to 2.5% in February. In China, the government is targeting 5% growth this year. Industrial production and investment data were better than expected. The risky asset markets continued to rise in March despite profit-taking near the end of the quarter. Bond markets also performed well. The 10-year US T-note dropped from 4.25% to 4.20%, i.e. a decrease of 5 basis points, with the 2-10 year curve flattening by 5 basis points. The statements by Christopher Waller regarding concerns about the level of inflation revived the upward pressure on the short term (2 years) at the end of the month.

We maintained our preference for high yield issuers, with a preference for BB rated issuers that offer attractive risk-adjusted return characteristics as well as some distressed countries. These were supported by encouraging news flows, particularly Zambia, which has come to the end of a long restructuring process and is back in investors' favour. At the same time, we reduced our positions in Ecuador and El Salvador to neutral given the performances achieved. Regarding our interest rate risk, we increased our duration with the rise in US rates to levels of 4.30%.

The portfolio posted a performance in line with its benchmark index during the month with a slight outperformance. Our overweight in high yield issuers contributed positively to the performance, notably our investments in Egypt, Ghana, Angola and Côte d'Ivoire. As the portfolio's sensitivity to US rates was fairly close to its benchmark, there were no significant impacts in terms of duration. Our local debt diversifications also had a neutral impact with an outperformance of Mexico (fully linked to the Mexican peso) offset by lacklustre performances in Brazil and Indonesia.

The narrowing trend of risk premiums remained intact in March with the support of high yield countries. The news that supported this movement for some of them is fairly structural and the effects are likely to continue although phases of profit-taking cannot be ruled out. Attention must therefore be paid to these specific risks. Given the upward trajectory of US rates, the average yield of the asset class remains at attractive levels (7.8% on average) in light of the fund's horizon. The decisions of the US Fed remain decisive for most risky markets and will receive particular attention. We will therefore continue to be active on our rate sensitivity and will use any price volatility returns to adjust our investments.

Calculation of performance during periods of share class inactivity (if applicable)
For periods when certain share classes were unsubscribed or not yet created (the "inactive share classes"), performance is imputed using the actual performance of the fund's active share class which has been determined by the management company as having the closest characteristics to such inactive share class and adjusting it based on the difference in TERs and, where applicable, converting the net asset value of the active share class into the currency of quotation of the inactive share class. The quoted performance for such inactive share class is the result of an indicative calculation.
Illustrative Growth of 10,000
The graph compares the growth of 10, 000 in a fund with that of an index. The total returns are not adjusted to reflect sales charges or the effects of taxation, but are adjusted to reflect actual ongoing fund expenses, and assume reinvestment of dividends and capital gains. If adjusted, sales charges would reduce the performance quoted. The index is an unmanaged portfolio of specified securities and cannot be invested in directly. The index does not reflect any initial or ongoing expenses. A fund's portfolio may differ significantly from the securities in the index. The index is chosen by the fund manager.
Risk Measures
The "Summary Risk Indicator" (SRI), as defined by the PRIIPs regulation, is a risk measure based on both market risk and credit risk. It is based on the assumption that you stay invested in the fund for the recommended holding period. It is calculated periodically and may change over time. The indicator is presented on a numerical scale from 1(the lowest risk) to 7 (the highest risk).
The risk measures below are calculated for funds with at least a three-year history.
Standard deviation is a statistical measure of the volatility of the fund's returns.
Tracking Error is reported as a standard deviation percentage difference between the performance of the portfolio and the performance of the reference index. The lower the Tracking Error, the more the fund performance resembles to the performance of its reference index.
The Sharpe ratio uses standard deviation and excess return to determine reward per unit of risk.
The Information Ratio is the difference between the fund's average annualized performance and the reference index divided by the standard deviation of the Tracking Error. The information ratio measures the portfolio manager's ability to generate excess returns relative to the reference index.
Alpha measures the difference between a fund's actual returns and its expected performance, given its level of risk (as measured by beta). Alpha is often seen as a measure of the value added or subtracted by a portfolio manager.
Beta is a measure of a fund's sensitivity to market movements. A portfolio with a beta greater than 1 is more volatile than the market, and a portfolio with a beta less than 1 is less volatile than the market.
R-squared reflects the percentage of a fund's movements that are explained by movements in its benchmark index, showing the degree of correlation between the fund and the benchmark. This figure is also helpful in assessing how likely it is that alpha and beta are statistically significant.
Morningstar Rating and Category
© 2024 Morningstar. All Rights Reserved. The information, data, analyses and opinions ("Information") contained herein (1) include Morningstar's confidential and proprietary information (2) may not be copied or redistributed, (3) do not constitute investment advice (4) are provided solely for informational purposes (5) are not warranted to be complete, accurate or timely and (6) are drawn from fund data published on various dates. The information is provided to you at your own risk. Morningstar is not responsible for any trading decisions, damages or other losses related to the Information or its use. Please verify all of the Information before using it and don't make any investment decision except upon the advice of a professional financial adviser. Past performance is no guarantee of future results. The value and income derived from investments can go up or down. The Morningstar rating applies to funds having at least 3 years of history. It takes into account subscription fee, the yield without risk and the standard deviation to calculate for every fund its ratio MRAR (Morningstar Risk Adjust Return). Funds are then classified in decreasing order by MRAR: first 10 per cent receive 5 stars, the following 22.5 % 4 stars, the following 35 % 3 stars, following 22.5 % 2 stars, the last 10 % receive 1 star. Funds are classified within 180 European categories.
Reference Index
The Sub-Fund is actively managed. The Reference Index is used for comparison purposes only. The Delegated Investment Manager remains free to choose the securities that make up the portfolio in accordance with the Sub-Fund's investment policy.
Asset allocation
Cash offset for Derivatives represents the amount of cash the portfolio manager should borrow if he's Long exposed via derivatives and vice versa. The weighting of the portfolio in various asset classes, including "Other," is shown in this table. "Other" includes security types that are not neatly classified in the other asset classes, such as convertible bonds and preferred stocks. In the table, allocation to the classes is shown for long positions, short positions, and net (long positions net of short) positions. These statistics summarize what the managers are buying and how they are positioning the portfolio. When short positions are captured in these portfolio statistics, investors get a more robust description of the funds' exposure and risk.

Fund Charges: The "All-in Fee" is defined as the aggregate of Management Fees and Administration Fees paid annually by each Sub-Fund, other than taxes (such as "Taxe d'abonnement") and expenses relating to the creation or liquidation of any SubFund or Share Class; the All in Fee shall not exceed such percentage of each Sub-Fund's average daily net asset value as indicated in each Sub-Fund's description under "Characteristics." The All-in Fee paid by each Share Class, as indicated in each Sub-Fund's description, does not necessarily include all the expenses linked to the FCP's investments (such as the taxe d'abonnement, brokerage fees, expenses linked to withholding tax reclaims) that are paid by such FCP. Unless otherwise provided for in any Sub-Fund's description, if the yearly actual expenses paid by any Sub-Fund exceed the applicable All-in Fee, the Management Company will support the difference and the corresponding income will be recorded under Management Company fees in the FCP's audited annual report. If the yearly actual expenses paid by each Sub-Fund are lower than the applicable All-in Fee, the Management Company will keep the difference and the corresponding charge will be recorded under Management Company fees in the FCP's audited annual report.
Equity Portfolio Statistics (if applicable)
The referenced data elements below are a weighted average of the long equity holdings in the portfolio. The Price/Earnings ratio is a weighted average of the price/earnings ratios of the stocks in the underlying fund's portfolio. The P/E ratio of a stock is calculated by dividing the current price of the stock by its trailing 12-months' earnings per share. The Price/Cash Flow ratio is a weighted average of the price/cash-flow ratios of the stocks in a fund's portfolio. Price/ cashflow shows the ability of a business to generate cash and acts as a gauge of liquidity and solvency. The Price/Book ratio is a weighted average of the price/book ratios of all the stocks in the underlying fund's portfolio. The P/B ratio of a company is calculated by dividing the market price of its stock by the company's per-share book value. Stocks with negative book values are excluded from this calculation. Dividend Yield is the rate of return on an investment expressed as a percent. Yield is calculated by dividing the amount you receive annually in dividends or interest by the amount you spent to buy the investment.
Fixed-Income Portfolio Statistics (if applicable)
The referenced data elements below are a weighted average of the long fixed income holdings in the portfolio. Duration measures the sensitivity of a fixed income security's price to changes in interest rates. Average maturity is a weighted average of all the maturities of the bonds in a portfolio, computed by weighting each maturity date by the market value of the security. Modified Duration is inversely related to percentage change in price on an average for a specific change in yield. The average coupon corresponds to the individual coupon of each bond in the portfolio, weighted by the nominal amount of these very same securities. The average coupon is calculated only on fixed rate bonds. The Yield to maturity (YTM) reflects the total return of a bond, if the bond is held until maturity, considering all the payments are reinvested at the same rate. This indicator can be calculated at the portfolio level, by weighting the individual YTM by the market value of each bond.
Performance fees
The performance fee applicable to a particular share class is calculated according to an indexed assets approach, i.e. based on a comparison of the valued assets of the UCITS and the reference assets, which serves as a basis for the calculation of the performance fee. The reference period, which corresponds to the period during which the performance of the UCITS is measured and compared to that of the reference index, is capped at five years. The management company shall ensure that, over a performance period of a maximum five (5) years, any underperformance of the UCITS in relation to the reference index is compensated for before performance fees become payable. The start date of the reference period and starting value of the performance reference assets will be reset if underperformance has not been compensated for and ceases to be relevant as the five-year period elapses.

Special Risk Considerations
Risk of capital loss: the net asset value is likely to fluctuate widely because of the financial instruments that make up the Fund's portfolio. Under these conditions, the invested capital may not be fully returned, including for an investment made over the recommended investment period.
Changes in Laws and/or Tax Regimes: Each Fund is subject to the laws and tax regime of Luxembourg. The securities held by each Fund and their issuers will be subject to the laws and tax regimes of various other countries. Changes to any of those laws and tax regimes, or any tax treaty between Luxembourg and another country, could adversely affect the value of any Fund holding those securities.
Counterparty risk: The Fund uses over-the-counter derivatives and/or temporary sales and repurchases of securities. These transactions, undertaken with one or more eligible counterparties, potentially expose the Fund to the risk that one of its counterparties could fail, which could lead to a default in payment.
Credit risk: (the risk of the fund's net asset value falling due to an increase in the yield spreads of private issues in the portfolio, or even a default on an issue), as certain alternative management strategies (interest rate arbitrage, distressed securities, convertible arbitrage and global macro in particular) may be exposed to credit. Increases in the yield spreads of private issues in the portfolio, or even a default on an issue, may cause the fund's net asset value to fall.
Emerging markets risk: Funds investing in emerging markets may be significantly affected by adverse political, economic or regulatory developments. Investing in emerging markets may not provide the same degree of investor protection or information to investors as would generally apply in major securities markets. In addition, exchanges in emerging markets may be very fluctuating. Finally, funds may not be able to sell securities quickly and easily in emerging markets.
Exchange Rates: Some Funds are invested in currencies other than their reference currency. Changes in foreign currency exchange rates will affect the value of those securities held by such Sub-Funds. For unhedged Share Classes denominated in currencies different than the Fund's currency, exchange rate fluctuations can generate additional volatility at the Share Class level.
Financial Derivatives Instruments: Derivatives, such as options, futures and forward contracts, involves risk of loss and may entail additional risks. These include lack of liquidity, possible losses greater than the Fund's initial investment, increased transaction costs, and higher volatility. Option premiums paid for or received by the Fund are small relative to the market value of the investments underlying the options. This means that buying and selling put and call options can be more speculative than investing directly in the securities they represent. Under certain market conditions, the Fund could be forced to sell securities or to close derivative positions at a loss. Because derivatives depend on the performance of an underlying asset, they can be highly volatile and are subject to market and credit risks.
Geographic concentration risk: Funds that concentrate investments in certain geographic regions may suffer losses, particularly when the economies of those regions experience difficulties or when investing in those regions become less attractive. Moreover, the markets in which the funds' invest may be significantly affected by adverse political, economic or regulatory developments.
Interest rate risk: as certain alternative management strategies (interest rate arbitrage, futures funds, and global macro) may have either a positive or negative exposure to interest rates. These exposures may cause the fund's net asset value to fall in line with changes in the interest rate markets. However, this risk is limited through strategies which are not tied to the main interest rate markets.
Liquidity risk: the liquidity risk, which may arise in the event of large-scale redemptions of fund units, is tied to the difficulty in closing out positions under optimal financial conditions.
Portfolio Concentration risk: Funds investing in a limited number of securities may increase the fluctuation of such funds' investment performance. If such securities perform poorly, the fund could incur greater losses than if it had invested in a larger number of securities.
Stock Connect risk: The Fund may invest in China "A" shares via the Shanghai-Hong Kong Stock Connect and/or Shenzhen-Hong Kong Stock Connect programs which are subject to additional clearing and settlement constraints, potential regulatory changes as well as operational and counterparty risks.
Investment in CNH Bonds: CNH Bonds are bonds denominated in the Chinese currency, the Renminbi (RMB) issued in the offshore market - for instance the Central Money Markets Unit in Hong Kong. Investing in CNH Bonds involves greater risks than those generally associated with debt securities (changing interest rates, credit risk...) and with investing in developed markets.
Please refer to the full prospectus, for additional details on risks.

The fund is a sub-fund of Natixis International Funds (Lux) I which is organized as an investment company with variable capital under the laws of the Grand Duchy of Luxembourg and is authorized by the financial regulator (the CSSF) as a UCITS - 2-8 avenue Charles de Gaulle, L1653 Luxembourg - RCS Luxembourg B 53023.
