

GLOBAL HYBRIDS BOND FUND Y-ACC-EURO (HEDGED)

30 APRIL 2021

Strategy

The fund seeks a high level of current income and the potential for capital appreciation by investing in hybrid bonds ("Hybrids"): debt securities with equity-like features. The fund primarily invests in Hybrids issued by non-financial institutions (corporate Hybrids) and by financial institutions (financial Hybrids), including contingent convertibles, as well as in other subordinated financial debt and preference shares. These investments include investment grade and non-investment grade assets. The fund is managed according to Fidelity's active philosophy and approach to fixed income investing. This is team-based, but led by the Portfolio Manager to generate attractive risk-adjusted returns through combining multiple, diversified investment positions advised by in-house fundamental credit research, quantitative modelling and specialist traders.

Objectives & Investment Policy

- The fund aims to provide a high level of current income and the potential for capital growth.
- The fund will invest at least 70% in hybrid bonds ("Hybrids"), that is bonds with equity-like features issued by non-financial institutions (corporate Hybrids) and by financial institutions (financial Hybrids), including contingent convertibles, as well as into other subordinated financial bonds and preference shares, globally.
- The fund will invest at least 50% of its net assets in securities that maintain sustainable characteristics. On an ongoing basis, the fund will consider a wide range of environmental and social characteristics such as climate change mitigation and adaptation, water and waste management, biodiversity, product safety, supply chain, health and safety and human rights.
- The fund adheres to the firm-wide exclusion list which includes but is not limited to, cluster munitions and anti-personnel landmines. Equally, issuers which the Investment Manager considers have failed to conduct their business in accordance with accepted international norms, including as set out in the United Nations Global Compact, will not form part of the fund's investment universe, in accordance with the norms-based screening applied by the Investment Manager.
- The fund's investments include investment grade and non-investment grade assets.
- As this fund may invest globally, it may invest in countries considered to be emerging markets.
- Other subordinated financial bonds and preference shares do not have a conversion feature but rank behind senior bonds in case of insolvency.
- The fund has the freedom to invest outside its principal asset classes and may invest up to 30% in Money Market Instruments, cash and bank deposits, as well as other transferable securities.
- The fund may invest in assets directly or achieve exposure indirectly through other eligible means including derivatives. The fund can use derivatives with the aim of risk or cost reduction or to generate additional capital or income, including for investment purposes, in line with the fund's risk profile.
- Investments may be made in currencies other than the fund's reference currency. Exposure to currencies may be hedged, for example with currency forward contracts. The fund's reference currency is the currency used for reporting and may be different from the currency of denomination of the investments.
- Currency hedging is used to substantially reduce the risk of losses from unfavourable exchange rate movements. Currency look-through hedging is used to hedge the underlying currency effects to that of the hedged share class reference currency, thereby delivering the underlying market returns. In order to preserve returns from any active currency positions in the fund, such exposures are hedged with reference to the currency weights of a comparison index rather than to the currency denominations of the underlying securities.
- The fund is actively managed. The Investment Manager will, when selecting investments for the fund and for the purposes of monitoring risk, reference 50% ICE BofA Contingent Capital Index Hedged to EUR; 50% ICE BofA Global Hybrid Corporate Index Hedged to EUR (the "Index"). The fund's performance can be assessed against its Index. The Investment Manager has a wide range of discretion relative to the Index. While the fund will hold assets that are components of the Index, it may also invest in issuers, sectors, countries and security types that are not included in, and that have different weightings from, the Index in order to take advantage of investment opportunities.
- Income earned by the fund is accumulated in the share price.
- Investment in this fund is suitable for sophisticated investors who have the appropriate investment expertise to understand the key features and the risks associated with an investment in this fund.
- Shares can usually be bought and sold each business day of the fund.

Fund Facts

Launch date: 21.09.15
 Portfolio manager: Kris Atkinson, James Durance
 Appointed to fund: 21.09.15, 01.07.20
 Years at Fidelity: 21, 8
 Fund size: €112m
 Fund reference currency: US Dollar (USD)
 Fund domicile: Luxembourg
 Fund legal structure: SICAV
 Management company: FIL Investment Management (Luxembourg) S.A.
 Capital guarantee: No
 Portfolio Turnover Cost (PTC): 0.00%
 Portfolio Turnover Rate (PTR): 99.52%

Share Class Facts

Other share classes may be available. Please refer to the prospectus for more details.

Launch date: 21.09.15
 NAV price in share class currency: 13.3975
 ISIN: LU1261433111
 SEDOL: BYSFKQ0
 WKN: A14Y7F
 Bloomberg: FIDYAEH LX
 Dealing cut-off: 15:00 UK time (normally 16:00 Central European Time)
 Distribution type: Accumulating
 Ongoing Charges Figure (OCF) per year: 0.84% (30.04.20)
 OCF takes into account annual management charge per year: 0.55%

Share Class Risk and Reward Profile

This risk indicator is taken from the key information document at the relevant month-end. Because it may be updated during a month, please refer to the key information document for the most up-to-date information.

- The risk category was calculated using historical performance data.
- The risk category may not be a reliable indication of the future risk profile of the fund, is not guaranteed and may change over time.
- The lowest category does not mean a "risk free" investment.
- The risk and reward profile is classified by the level of historical fluctuation of the Net Asset Values of the share class, and within this classification, categories 1-2 indicate a low level of historical fluctuations, 3-5 a medium level and 6-7 a high level.

Important Information

The value of investments and any income from them may go down as well as up and an investor may not get back the amount invested. The use of financial derivative instruments may result in increased gains or losses within the fund. Liquidity is a measure of how easily an investment can be converted into cash. Under certain market conditions assets may be difficult to sell. There is a risk that the issuers of bonds may not be able to repay the money they have borrowed or make interest payments. When interest rates rise, bonds may fall in value. Rising interest rates may cause the value of your investment to fall. The investment policy of this fund means it can be more than 35% invested in Government and public securities. These can be issued or guaranteed by other countries and Governments. For a full list please refer to the fund's prospectus. The fund promotes environmental and/or social characteristics. The Investment Manager's focus on securities of issuers which maintain sustainable characteristics may affect the fund's investment performance favourably or unfavourably in comparison to similar funds without such focus. The sustainable characteristics of securities may change over time.

GLOBAL HYBRIDS BOND FUND Y-ACC-EURO (HEDGED)

30 APRIL 2021

Past performance is not a reliable indicator of future results. Currency hedging is used to substantially reduce the effect of currency exchange rate fluctuations on undesired currency exposures. There can be no assurance that the currency hedging employed will be successful. Hedging also has the effect of limiting the potential for currency gains to be made.

Performance Comparator(s)

Market index from 31.12.14 50% ICE BofA Contingent Capital Index Hedged to EUR; 50% ICE BofA Global Hybrid Corporate Index Hedged to EUR

Market index is for comparative purposes only unless specifically referenced in the Objectives & Investment Policy on page 1. The same index is used in the positioning tables on this factsheet.

Where the effective date for the current market index is after the share class launch date, full history is available from Fidelity.

Cumulative performance in EUR (rebased to 100)

Performance is shown for the last five years (or since launch for funds launched within that period).

Ranking within Peer Group Universe

Total number of funds	-	-	-	-	-	-	-
Quartile ranking**	-	-	-	-	-	-	-

Source of fund performance and volatility and risk measures is Fidelity. Performance is excluding initial charge.

Basis: nav-nav with income reinvested, in EUR, net of fees.

Market indices are sourced from RIMES and other data is sourced from third-party providers such as Morningstar.

*Performance commencement date.

**Quartile rank is for the fund's primary share class as identified by Morningstar, which may be different than the share class detailed in this factsheet and refers to performance over time rated on a scale of 1-4. A ranking of 1 indicates that the item being ranked is in the top 25% of the sample and so on. Rankings are based on a performance record that is included in the Peer Group Universe. In line with Investment Association methodology, this record may include a track record extension from a legacy share class and the record may not be the same class of this factsheet. Quartile ranking is an internal Fidelity International calculation. Ranking may vary by share class.

If you took an initial charge of 5.25% from an investment, this is the equivalent of reducing a growth rate of 6% per annum over 5 years to 4.9%. This is the highest initial charge applicable, if the initial charge you pay is less than 5.25%, the impact on the overall performance will be less.

Glossary

Volatility & Risk

Annualised volatility: a measure of how variable returns for a fund or comparative market index have been around their historical average (also known as “standard deviation”). Two funds may produce the same return over a period. The fund whose monthly returns have varied less will have a lower annualised volatility and will be considered to have achieved its returns with less risk. The calculation is the standard deviation of 36 monthly returns presented as an annualised number. Volatility for funds and indices are calculated independently of each other.

Relative volatility: a ratio calculated by comparing the annualised volatility of a fund to the annualised volatility of a comparative market index. A value greater than 1 indicates the fund has been more volatile than the index. A value less than 1 shows the fund has been less volatile than the index. A relative volatility of 1.2 means the fund has been 20% more volatile than the index, while a measure of 0.8 would mean the fund has been 20% less volatile than the index.

Sharpe ratio: a measure of a fund’s risk-adjusted performance, taking into account the return on a risk-free investment. The ratio allows an investor to assess whether the fund is generating adequate returns for the level of risk it is taking. The higher the ratio, the better the risk-adjusted performance has been. If the ratio is negative, the fund has returned less than the risk-free rate. The ratio is calculated by subtracting the risk-free return (such as cash) in the relevant currency from the fund’s return, then dividing the result by the fund’s volatility. It is calculated using annualised numbers.

Annualised alpha: the difference between a fund’s expected return (based on its beta) and the fund’s actual return. A fund with a positive alpha has delivered more return than would be expected given its beta.

Beta: a measure of a fund’s sensitivity to market movements (as represented by a market index). The beta of the market is 1.00 by definition. A beta of 1.10 shows that the fund could be expected to perform 10% better than the index in up markets and 10% worse in down markets, assuming all other factors remain constant. Conversely, a beta of 0.85 indicates that the fund could be expected to perform 15% worse than the market return during up markets and 15% better during down markets.

Annualised tracking error: a measure showing how closely a fund follows the index to which it is being compared. It is the standard deviation of the fund’s excess returns. The higher the fund’s tracking error, the higher the variability of fund returns around the market index.

Information ratio: a measure of a fund’s effectiveness in generating excess return for the level of risk taken. An information ratio of 0.5 shows the fund has delivered an annualised excess return equivalent to half the value of the tracking error. The ratio is calculated by taking the fund’s annualised excess return and dividing it by the fund’s tracking error.

R2: a measure representing the degree to which a fund’s return can be explained by the returns of a comparative market index. A value of 1 signifies the fund and index are perfectly correlated. A measure of 0.5 means only 50% of the fund’s performance can be explained by the index. If the R2 is 0.5 or lower, the fund’s beta (and therefore its alpha too) is not a reliable measure (due to a low correlation between fund and index).

Ongoing charges

The ongoing charges figure represents the charges taken from the fund over a year. It is calculated at the fund’s financial year end and may vary from year to year. For classes of funds with fixed ongoing charges, this may not vary from year to year. For new classes of funds or classes undergoing corporate actions (eg amendment to annual management charge), the ongoing charges figure is estimated until the criteria are met for an actual ongoing charges figure to be published.

The types of charges included in the ongoing charges figure are management fees, administration fees, custodian and depositary fees and transaction charges, shareholder reporting costs, regulatory registration fees, Directors fees (where applicable) and bank charges.

It excludes: performance fees (where applicable); portfolio transaction costs, except in the case of an entry/exit charge paid by the fund when buying or selling units in another collective investment undertaking.

For more information about charges (including details of the fund’s financial year end), please consult the charges section in the most recent Prospectus.

Independent Assessment

Scope Fund Rating: The rating measures how well a fund has balanced risk and reward relative to its peers. The rating is based solely on performance for funds with a five year track record. Funds with a shorter history also undergo qualitative assessment. For example, this may include looking at management style. The rating scale is A = very good, B = good, C = average, D = below average and E = poor.

Morningstar Star Rating for Funds: The rating measures how well a fund has balanced risk and reward relative to its peers. Star ratings are strictly based on past performance and Morningstar suggests investors use them to identify funds that are worthy for further research. The top 10% of funds in a category will receive a 5-star rating and the next 22.5% receive a 4-star rating. Only ratings of 4 or 5 stars are displayed on the factsheet.

Morningstar Style Box: The Morningstar Style Box is a nine-square grid that provides a graphical representation of the investment style of funds. It is based on fund holdings and classifies funds according to market capitalisation (the vertical axis) and growth and value factors (the horizontal axis). The value and growth factors are based on measures such as earnings, cashflow and dividend yield and use both historical and forward-looking data.

Primary share class: is identified by Morningstar when the analysis calls for only one share class per fund to be in the peer group. It is the share class Morningstar recommends as the best proxy for the portfolio for the relevant market and category/GIF combination. In most cases the share class chosen will be the most retail version (based upon actual management charge, inception date, distribution status, currency and other factors) unless a share class that is less retail focused has a much longer track record. It is different to the oldest share class data point in that it is on an available for sale level and not all markets will have the oldest share class for sale in that region. The Primary share class is also based on category so each available for sale/category combination for the fund will have its own primary share class.

Glossary

Portfolio Characteristics

Distribution Yield (%)

The Distribution Yield reflects the amounts that may be expected to be distributed over the next twelve months as a percentage of the mid-market unit price of the fund as at the date shown and is based on a snapshot of the portfolio on that day. It includes the fund's ongoing charges but does not include any preliminary charge and investors may be subject to tax on distributions.

Effective Duration

Duration is a measure of sensitivity of the fund value to changes in interest rates.

Effective duration is a duration calculation for bonds with embedded options (such as a call or a put option). It takes into account that expected cash flows will fluctuate as interest rates change and affect a bond's price.

The effective duration of a fund is calculated by a market weighted sum of the effective duration of each individual instrument. The effect of derivatives such as bond futures and interest rate swaps are included in the calculation.

Running Yield (%)

Describes the income investors get from their portfolio as a percentage of market value of the securities, incorporating the effect of derivatives. It should not be relied on as a measure of expected fund return (or distribution). Bonds with high probability of default are excluded from the calculation. The running yield does not reflect the total return over the life of the bond and takes no account of reinvestment risk (the uncertainty about the rate at which future cash flows can be reinvested) or the fact that bonds usually mature at par value, which can be an important component of a bond's return. The running yield does not include the impact of fees.

Yield to Maturity (%)

The Yield to Maturity (also known as the Redemption Yield) is the aggregate of all anticipated returns on each individual bond within the portfolio expressed as an annual rate based on market value as at date shown, coupon rate and time to maturity of each bond. It is based on a snapshot of the portfolio on that date. The redemption yield is gross of the fund's charges and gross of tax.

Average Maturity (Years)

The market-weighted average maturity of bonds held in the portfolio. Perpetual bonds are assigned a maturity of 31 December 2049. Derivatives are excluded from the calculation.

Average Coupon (%)

The coupon is the interest rate stated on a bond when it is issued. Average Coupon is the weighted average coupon of bonds held in the portfolio. Derivatives are excluded from the calculation.

Spread Duration

The sensitivity of the price of a bond to a change in its Option Adjusted Spread.

Option Adjusted Spread (Basis Points)

Option Adjusted Spread (OAS) measures the yield spread that is not directly attributable to the bond's characteristics. OAS is a measurement tool for evaluating price differences between similar bonds with different embedded options. A larger OAS implies a greater return for greater risks.

Duration Times Spread (DTS)

DTS is a measure of credit risk sensitivity that utilises credit spread and credit spread duration based on current market valuations. It is superior to spread duration as a standalone measure of credit risk because it recognises that securities with a higher spread tend to experience greater spread changes. The portfolio's DTS is the value weighted sum of the DTS of each individual instrument.

Number of Holdings

The number of bonds and derivatives held in the fund. Where the fund invests in another fund, it is counted as one holding. FX (foreign exchange) forwards are excluded. These are forward contracts that allow currency to be bought or sold at an agreed price on a future date.

Number of Names

The total number of individual issuers whose bonds are held in the fund. Since the fund will often hold more than one bond from an issuer, this figure is generally lower than the number of holdings.

Average Credit Rating

This is the weighted average of all the bond credit ratings in the fund, expressed using the industry standard letter system (ie AAA, BBB). It takes into account all investments in the fund, including derivatives. This measure gives an idea of how risky the fund's bonds are overall: the lower the average credit rating, the riskier the fund.

With a Linear weighted average, the weight assigned to each issue is equal to its market value weight. With an Exponential weighted average, the weight gets proportionally higher for lower-quality credit. In both calculations, the final value is the S&P-equivalent rating nearest to the calculated average.

Primary share class: is identified by Morningstar when the analysis calls for only one share class per fund to be in the peer group. It is the share class Morningstar recommends as the best proxy for the portfolio for the relevant market and category/GIF combination. In most cases the share class chosen will be the most retail version (based upon actual management charge, inception date, distribution status, currency and other factors) unless a share class that is less retailed focused has a much longer track record. It is different to the oldest share class data point in that it is on an available for sale level and not all markets will have the oldest share class for sale in that region. The Primary share class is also based on category so each available for sale/category combination for the fund will have its own primary share class.

Portfolio Turnover Rate (PTR) and Portfolio Turnover Cost (PTC), where shown: SRDII does not define a methodology for these values; ours is as follows: **PTR** = (purchases of securities + sales of securities) minus (subscriptions of units + redemptions of units), divided by average fund value over the prior 12 months multiplied by 100. Any funds' trading in Fidelity Institutional Liquidity Funds is excluded from the PTR calculation. **PTC** = PTR (capped at 100%) x transaction cost, where transaction cost is calculated as ex-post (i.e. prior 12 months) MiFID disclosure of portfolio transaction costs minus implicit costs.
